Your computer organizes and knows where to store all your data with Graphical user interface and Command-line interface. They are both the same in essence. They mirror that same information of where your files and data is saved to, in two different visuals for you to understand. Graphical user interface are the files and folders we all see when opening windows or finder. Finder shows where files and folders are stored, in a visually tangible way, under documents or desktop; that visual representation is what's called GUI. CLI is the mirrored coding version of those same files that's the computer's technical organization. Your computer codes each files and organizes it in a visual terminal, less appealing to the eye, this is CLI. Think of GUI and CLI of two different way of understanding how to find things on your computer.
